Immersion in nonhuman worlds

How is today's digital landscape and network culture influenced by cats as a popular subject? The authors invite you to dive into a virtual world inhabited solely by cats and join their vision.

*You caught and brought me a mouse. You would have eaten it yourself,
but decided to share it with me.*

Immersion in nonhuman worlds

Nika SandlerAlexander Mikhailov2024-05-08

As individuals with a passion for cats, Alexander Mikhailov (D3mark0) and I sought to deepen our understanding of these fascinating creatures and our connections with them. To achieve this, we created a [digital interactive city](#) using the Unity game engine.

It is a place solely inhabited by cats, where they live freely and independently. Their actions are not subject to the player's will and may even hinder the player by disrupting game animations and consuming all personal computer resources.

In this city, the player undergoes a transformation. His-her vision becomes more sensitive in the dark, and the world around him-her takes on a blue-green hue. His-her body position shifts to that of a quadruped, and his-her gait acquires an extraordinary grace.

He-she wanders around the city as a local and comes across pictures taken by cats along the roads. These shots capture moments from the cats' life, including the careful exploration of their surroundings, skilful hunting of animals, and keen observation of humans.

The player can jump onto the roofs of buildings and continue his-her walk. From up there, he-she will see pictures frozen in the air, depicting still lifes of cats' favourite things, as well as footage of their antics and adventures.

At the top, the player can also discover the hidden corners of the city. These spaces showcase archival photographs that reveal the close relationship between the person and the cats. Some of the cat images are heavily cropped and enlarged, resulting in a blurry effect that reflects the limitations of human memory and feline farsightedness. In another corner, there are concise poetic notes written by the person captured in the archival footage, discussing the time spent with the cats and their impact.

Our virtual work responds to the growing popularity of video clips recorded with action cameras attached to cats' collars on [Instagram](#) and [YouTube](#), as well as the creation of a special [filter in TikTok](#) that mimics cats' colour perception. This trend highlights the evolving role of cats in digital culture, transitioning from being objects of the human gaze to subjects. Our game reflects this trend by allowing the player to experience feline agency.
